ADVISORY: OFF-SEASON Page 8 of 25 In the first study, negative adolescent symptoms predicted the index of psychological inflexibility (Phillips et al.,. The second study examined the relationship between negative adult symptoms and rigid attitudes (Cohen et al., 2013), and the third study examined the relationship between non-

---

compliance in adolescent-parent conflict and non-aggressive adult attachments (DeGraft-Johnson et al., 2013). The fourth study examined the relationship between lifetime diagnosis of narcissistic personality disorder and adult interpersonal problems (Manning et al., 2013). In all of these studies, positive relationships were found. CADMAS 2013

MIDLAND/MASTERCARD ADVISORY: OFF-

SEASON Page 9 of 25 Despite differences in sample size, and study objectives, the results of the four studies provide solid evidence that negative interpersonal features in young adulthood relate to several psychiatric problems in later adulthood. Collectively, these studies support the view that negative interpersonal features in childhood predict several types of psychiatric problems, including conduct disorder, attention deficit

---

hyperactivity disorder, schizophrenia, affective disorder, and personality disorder. Additional support for these relationships can be found in a recent study by Osgood et al. (2016). Osgood and colleagues investigated a wide range of psychiatric diagnoses in a sample of over one thousand older adults. Among the various diagnoses examined, they found that those who had a history of antisocial personality disorder had an increased risk of having an anxiety disorder, depression, alcohol and substance use disorders, personality disorder, and obsessive compulsive disorder. The ability of negative
